PyGameMaker Junior: Make Your Own Game

Keep this sheet next to your computer. Do each part, then tick the box. Stuck? Ask a neighbour first, then your teacher.

Part 1: Start a Project

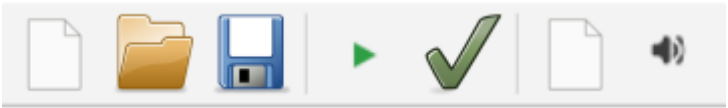

When the program starts, you see this:

- [ ] Click **New Project**.
- [ ] Give your project a name, for example MyGame.
- [ ] Click **OK**.

Part 2: Your Tools

Look at the top of the window:

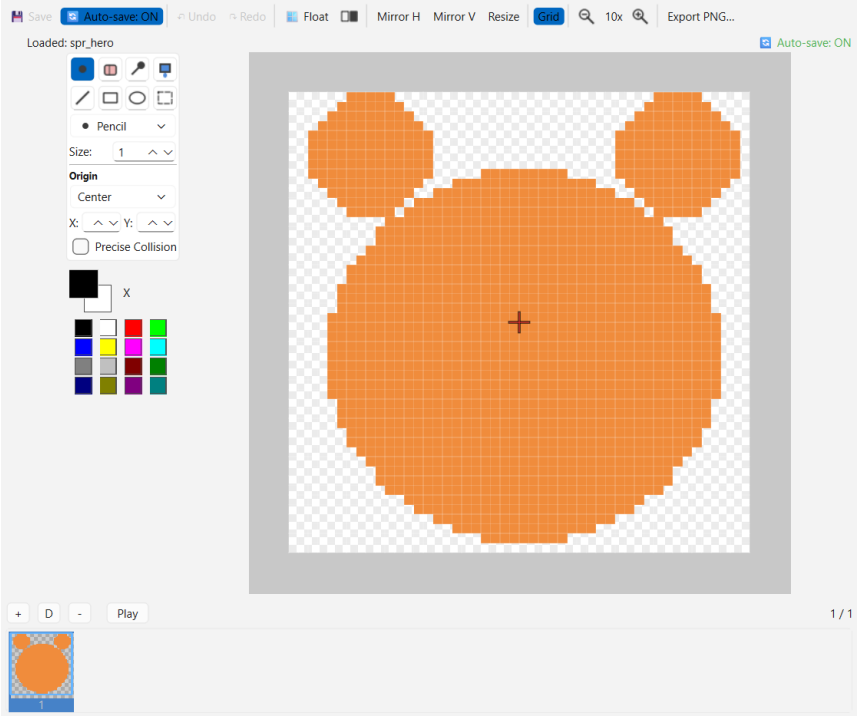

- **New**: start a game
- **Open**: open a game you saved
- **Save**: save your game. Do this often!
- **Green triangle**: play your game (or press **F5**)
- **Green tick**: share your game

On the left you have your **resources**: sprites, objects and rooms.

- A **sprite** is a picture.
- An **object** does things in your game.
- A **room** is a level (a screen of your game).

Part 3: Draw a Sprite

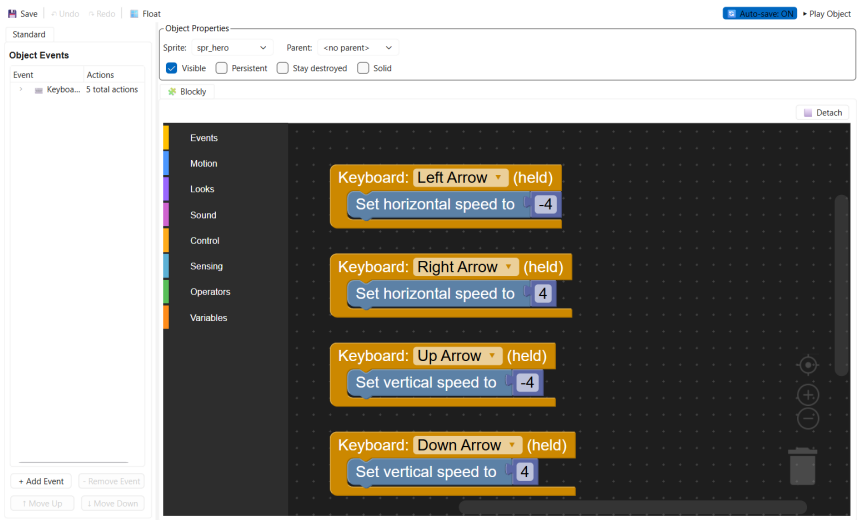

- [ ] Click **Assets > Create Sprite**.
- [ ] Give it a name, for example spr_hero.
- [ ] Choose a colour and draw with the pencil.
- [ ] Click **Save**.

> Start the names of your sprites with spr_.

Part 4: Make an Object Move in 4 Directions

- [ ] Click **Assets > Create Object** and name it obj_hero.
- [ ] In **Sprite**, choose your sprite.
- [ ] Add 4 **Keyboard** blocks (Left Arrow, Right Arrow, Up Arrow, Down Arrow). In each one, put **Set horizontal speed** or **Set vertical speed to**: left -4, right 4, up -4, down 4.
- [ ] Add **Keyboard: No key**, then **Stop movement**, so your hero stops when you touch nothing.

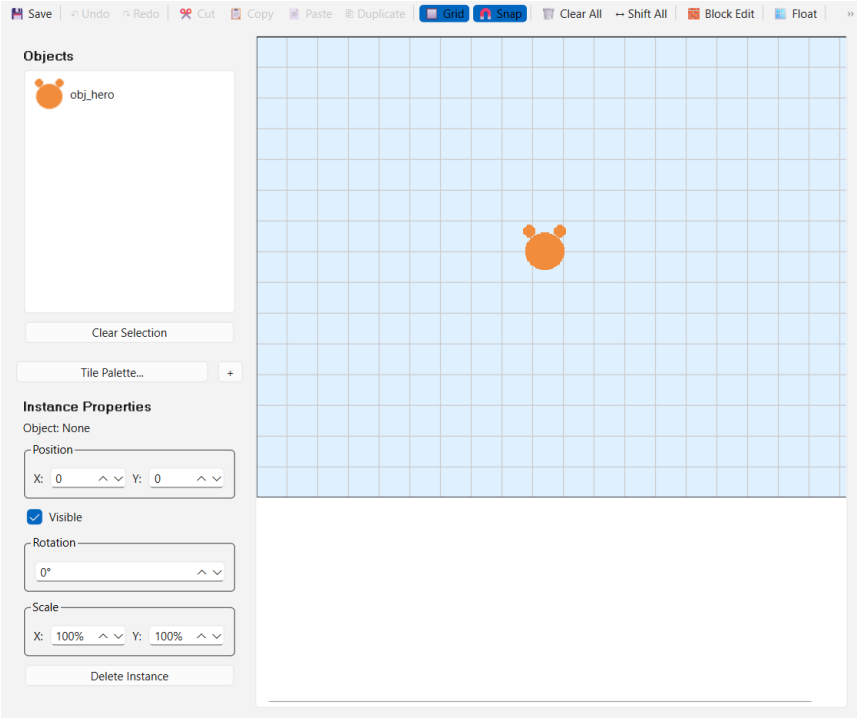

Right-click a block to duplicate or delete it. Duplicate the **Left Arrow** block three times, then just change the key and the number in each copy!

Part 5: Build a Room and Play

Your project already has a room, **room0**. You do not need to create one!

- [ ] Double-click **room0** in the **Rooms** list on the left.
- [ ] Click your object in the list, then click in the room to place it.

- [ ] Press the **green triangle** (or **F5**) to play.

You can rename **room0** if you want (right-click > Rename).

You see your sprite in the game and you can make it move.

Part 6: Share Your Game

- [ ] Click **File > Export as HTML5**.
- [ ] Choose a folder.
- [ ] Click **Yes** to open it in your browser.

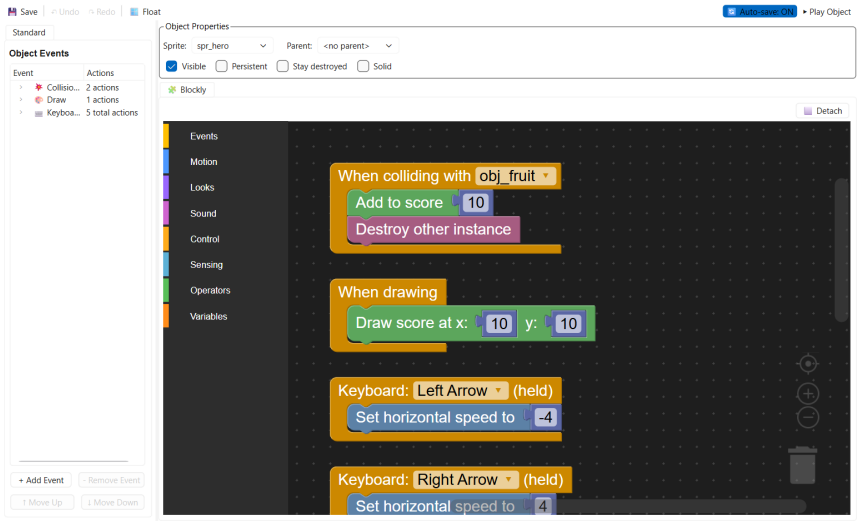

You get a file ending in .html. Send it to a friend: they can play it!

Part 7: BONUS: Pick Up Fruit!

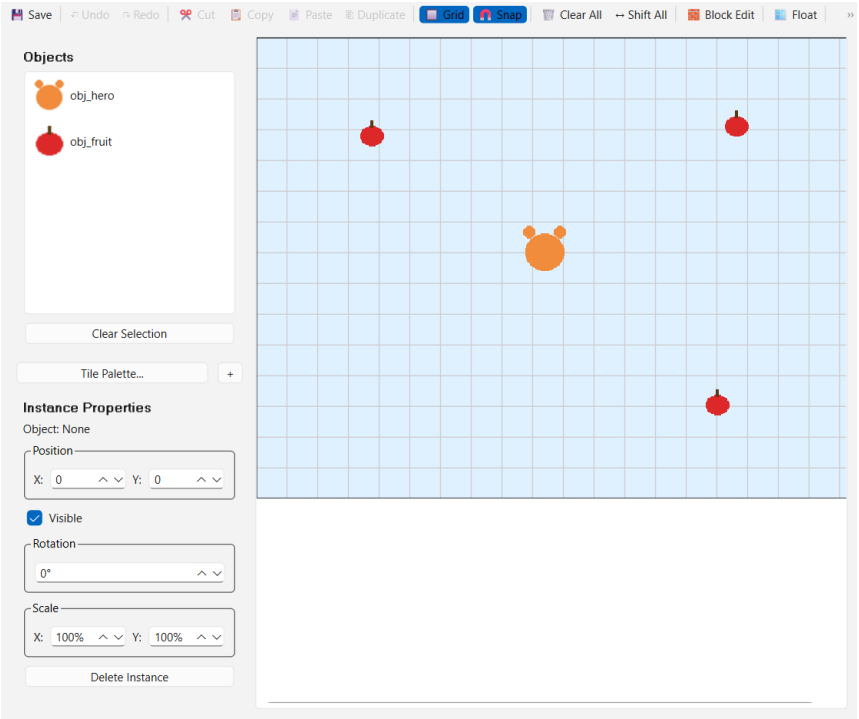

Your game already works. If you still have time, add points!

- [ ] Create a sprite spr_fruit (a small red or yellow circle).
- [ ] Create an object obj_fruit with this sprite.
- [ ] Open **obj_hero** and add the event **When colliding with obj_fruit**.
- [ ] Put 2 blocks in it: **Add to score 10** and **Destroy other instance**.

- [ ] Add the event **When drawing**, with the block **Draw score at x: 10 y: 10**.

- [ ] Go back to **room0** and place 2 or 3 obj_fruit in the room.

- [ ] Press **F5**: pick up the fruit to win points!

> Your score goes up and the fruit disappears when you touch it.

Stuck?

What happens	Try this
My object does not move	Is there a block under **Keyboard**? Is the object in the room?
My hero never stops	Add **Keyboard: No key** + **Stop movement**
I cannot see my sprite	Did you choose the sprite in the **Sprite** box?
I deleted something by mistake	**Tools > Restore Deleted Assets**
The game shows a grey window	Wait a little, then try again

My score does not go up	Is the collision event on **obj_hero**, with the right object chosen?

Words to Know

- **Sprite**: a picture
- **Object**: a thing that does actions
- **Room**: a level (a screen of your game)
- **Block**: a piece of your program
- **Collision**: when two objects touch
- **Score**: your points

Challenges

- **Try this:** change the colour of your fruit, or how many points it is worth.
- **Push further:** add a second kind of fruit that is worth more points.

Think About It

1. What is the **Keyboard** block for?
2. What is the difference between a sprite and an object?

My Notes
